Developing Applications for iOS

Lecture 6:
View Controllers and Storyboarding

Content

- MVCs Working Together
- Segues
- Navigation Controllers
- View Controllers
- Tab Bar Controller
View Controller

- Your Controller in an MVC grouping is always a subclass of UIViewController.
- It manages a View (made up of subviews that you usually have some outlets/actions to/from).
- It is the link between that View and the Model (which is UI-independent).

So how do we grow our application to use multiple MVCs?

- We need infrastructure to manage them all.
- That’s what storyboards and “controllers of controllers” are all about.
What happens when your application gets more features?
• What happens when your application gets more features?
• We have to add more Views. Now all of your UI can’t fit in one MVC’s view.
MVCs Working Together

- What happens when your application gets more features?
- We never have an MVC's view span across screens. So we'll have to create a new MVC for these new features.
MVCs Working Together

- So how do we switch the screen to show this other MVC?
MVCs Working Together

- So how do we switch the screen to show this other MVC?
- We use a “controller of controllers” to do that. For example, a UINavigationController.
MVCs Working Together

The UINavigationController is a Controller whose View looks like this.
But it’s special because we can set its `rootViewController` outlet to another MVC.
MVCs Working Together

Nav Controller

It will embed that MVC’s View inside its own View.
Then a UI element in this View (e.g. a UIButton) can segue to the other MVC and its View will now appear in the UINavigationController.
MVCs Working Together
MVCs Working Together

Notice this Back button automatically appears.
MVCs Working Together

When we click it, we will go back to the first MVC.
MVCs Working Together
Segue

Demo

• Let’s talk about how the segue gets set up first.
• Then we’ll look at how we create a `UINavigationController` in our storyboard.
Segues

Demo

- You use the segue identifier in `prepare(for:sender:)` to figure out which segue is happening.
- Or you can use it to programmatically force a segue with `performSegue(withIdentifier:sender:)`.
- You can embed a View Controller in a `UINavigationController` from the Editor menu.
**UINavigationController**

- **UIView** obtained from the `view` property of the `UIViewController` most recently pushed (or root).
UINavigationController

- **UIView** obtained from the `view` property of the `UIViewController` most recently pushed (or root).

- **String** obtained from the `title` property of the `UIViewController` most recently pushed (or root).
**UINavigationController**

- **UIView** obtained from the `view` property of the `UIViewController` most recently pushed (or root).
- **String** obtained from the `title` property of the `UIViewController` most recently pushed (or root).
- An **Array** of `UIBarButtonItem` objects obtained from the `toolbarItems` property of the `UIViewController` most recently pushed (or root).
**UINavigationController**

- **UIView** obtained from the `view` property of the `UIViewController` most recently pushed (or root).

- **String** obtained from the `title` property of the `UIViewController` most recently pushed (or root).

- An **Array** of `UIBarButtonItems` obtained from the `toolbarItems` property of the `UIViewController` most recently pushed (or root).

- A **UIBarButtonItem** item whose title is a **String** obtained from the `title` property of the previous `UIViewController` that was pushed. It is being displayed on a button provided by the navigation controller which, when touched, will cause the previous `UIViewController` to reappear. This is a “back” button.
When does a pushed MVC pop off?

- Usually because the user presses the “back” button (shown on the previous slide).

- But it can happen programmatically as well with this `UINavigationController` instance method:
  ```swift
  func popViewController(animated: Bool) -> UIViewController?
  ```

- This does the same thing as clicking the back button.

- Somewhat rare to call this method. Usually we want the user in control of navigating the stack.

- But you might do it if some action the user takes in a view makes it irrelevant to be on screen.
Example

- Let’s say we push an MVC which displays a database record and has a delete button with this action:

```swift
@IBAction func deleteCurrentRecord(sender: UIButton)
{
    // delete the record we are displaying
    // we just deleted the record we are displaying!
    // so it does not make sense to be on screen anymore
    self.navigationController?.popViewControllerAnimated(true)
}
```

- All `UIViewController`s know the `UINavigationController` they are in. This is `nil` if they are not in one.
View Controller

Other kinds of segues besides Push

- Modal
  Puts the view controller up in a way that blocks the app until it is dismissed.

  People often use Modal UIs as a shortcut, so we don’t want to go to that too early. We’ll talk about Modal in detail later.

- Replace
  Replaces the right-hand side of a `UISplitViewController`.

- Popover
  Puts the view controller on the screen in a popover.

- Unwind
  Lets you dismiss view controllers that have been presented.

- Custom
  You can create your own subclasses of `UIStoryboardSegue`. 
Firing off a segue from code

- Sometimes it makes sense to segue directly when a button is touched, but not always.
- For example, what if you want to conditionally segue?
- You can programmatically invoke segues using this method in UIViewController:
  
  ```swift
  func performSegue(withIdentifier identifier: String, sender: Any?) {
  }
  ```

- The `identifier` is set in the attributes inspector in Xcode (we've seen how to do this during the Demo).
- The `sender` is the initiator of the segue (a UIButton or yourself (a UIViewController) usually).
Firing off a segue from code

- Here is an example:

```swift
@IBAction func bookHotelRoom()
{
    if self.desiredRoom == .doubleRoom
    {
        self.performSegue(withIdentifier: "AskAboutDouble",
                         sender: self)
    }
    else
    {
        self.performSegue(withIdentifier: "AskAboutSingle",
                           sender: self)
    }
}
```
Segues

When a segue happens, what goes on in my code?

- The segue offers the source View Controller the opportunity to “prepare” the new View Controller to come on screen.
- This method is sent to the View Controller that contains the button that initiated the segue:

```swift
override func prepare(for segue: UIStoryboardSegue, sender: Any?) {
    if segue.identifier == "DoAParticularThing"
    {
        let newController = segue.destination
        /* Send messages to newController to prepare it to
         * appear on screen.
         * The segue will do the work of putting the
         * new controller on screen. */
        newController.view.backgroundColor = UIColor.black
    }
}
```
Segues

When a segue happens, what goes on in my code?

- You should pass data the new View Controller needs in `prepare(for:sender:)` and “let it run”.

- Think of the new View Controller as part of the View of the Controller that initiates the segue.

- It must play by the same rules as a View in a MVC.

- For example, it should not talk back to you except through delegation.

- So, for complicated MVC relationships, you might well set the new View Controller’s delegate to `self` here.
Instantiating a `UIViewController` by name from a storyboard

- Sometimes you might want to put a View Controller on screen yourself (without using a segue).

```swift
let vcID = "Details"
let controller = self.storyboard?.instantiateViewController(withIdentifier: vcID)
```

- Usually you get the storyboard above from `self.storyboard` in an existing `UIViewController`.

- The identifier `vcID` must match a string you set in Interface Builder to identify a `UIViewController` there.
Instantiating a UIViewController by name from a storyboard

- Example: Creating a UIViewController in a target/action method. Lay out the View for a DetailsViewController in the storyboard and name it “Details”.

```swift
@IBAction func showDetails() {
    let details = self.storyboard?.instantiateViewController(withIdentifier: "Details") as! DetailsViewController
    details.infoDetailsNeeds = self.info
    self.navigationController?.pushViewController(details, animated: true)
}

- Note use of self.navigationController again when we push the new View Controller.
UITabBarController

Another “controller of controllers”

- Mostly set up with CTRL-drag just like navigation controller.
You CTRL-drag to create these connections in Interface Builder.

Doing so is setting the following property inside your `UITabBarController`:

```swift
var viewControllers: [UIViewController]? { get set }
```
By default this is the UIViewController’s title property (and no image). But usually you set both of these in your storyboard in Interface Builder.
UI_TabBarController

- UIViewController’s tabBarItem property can be used to set attributes for that View Controller's tab.

Example:

```swift
func somethingHappenedToShowABadgeValue()
{
    self.tabBarItem.badgeValue = "-"
}
```
UITabBarController

What if there are more than 5 View Controllers?
A More button appears.

- More button brings up a UI to let the user edit which buttons appear on bottom row.
- All happens automatically.
Combine

Is it possible to combine UINavigationController and UITabBarController?

• Certainly. Quite common.
• The UINavigationController always goes “inside” the UITabBarController.
• Never the other way around.

Demo (continued)
• How to combine the two “controller of controllers”.
Combine

PLACE'S AR IS THE FIRST APP IN THE APP STORE THAT LETS YOU FIND YOUR FACEBOOK FRIENDS IN AUGMENTED REALITY. THIS MAY SOUND UNBELIEVABLE BUT WE ARE GIVING THIS APP FOR FREE!

See the video if you are not convinced: http://www.youtube.com/watch?v=C-dtV3bsPpY

Using Places AR you just need to point the iPhone in any direction around yourself in order to see your friends locations with relevant information. You can also use it to discover near-by places.

To get location information you need to login with a Facebook account.
Modifying buttons and toolbar items in a navigation controller

- You can set most of this up in Interface Builder by dragging items into your scene.
- But you may want to add buttons or change buttons at run time too. Use UIViewController’s navigationItem property:

```swift
var navigationItem: UINavigationController { get }
```
Modifying buttons and toolbar items in a navigation controller

- Think of `navigationItem` as a holder for things `UINavigationController` will need when that `UIViewController` appears on screen.

```swift
var leftBarButtonItems: [UIBarButtonItem]? { get set }

var titleView: UIView? { get set }

var rightBarButtonItems: [UIBarButtonItem]? { get set }
```

- When this `UIViewController` is not on the top of the Navigation Controller stack:

```swift
@property (nonatomic, copy) UIBarButtonItem *backButtonItem;
```

These bar button items are not set via the `navigationItem`. They are set via the `toolbarItems` property in `UIViewController`.
